Technical Support

Helping Improve the Agricultural Industry

Commitment to research and development is the driving force behind our innovative technology, allowing Randox Food Diagnostics to become a global leader in screening for toxins and residues within feed and food. With a comprehensive range of testing solutions and validations across a range of matrices, we are changing the face of food safety and quality worldwide.

Over 35 years, Randox Food Diagnostics has developed a specific product portfolio including ELISA and Randox's patented Biochip Array Technology to suit the needs for feed and food screening. Putting the food and agricultural industries at the forefront of what we do has allowed Randox Food to become the industries trusted supplier of the most innovative technology within feed and food screening. Biochip Array Technology allows users to save time, consolidate costs and gain accurate results.

We offer screening solutions within feed and cereals for the following:

- Mycotoxins
- Coccidiostate
- Growth Promoters
- Antimicrobials

Biochip Array Technology

Randox's patented Biochip Array Technology (BAT) provides multiple results from a single, undivided sample with accurate and trusted results on a 9x9mm ceramic Biochip. Our unique technology is at the forefront of testing and provides a large number of results in less time when compared to other methods.

Randox's comprehensive test menus allow for the screening of multiple sample types, providing semi-quantitative results. These versatile arrays are ideal for the screening of feed and food, giving you the ability to accurately detect toxins and residues using a single platform. This technology ultimately provides a more informed decision on confirmatory analysis required.

Benefits

Simultaneous Detection

Multiplex testing facilitates simultaneous screening of mycotoxins and drug residues in feed and food samples.

Excellent Sensitivity

Unrivalled multi-analyte detection of contaminants to fulfil global regulatory requirements with qualitative and semi-quantitative formats available.

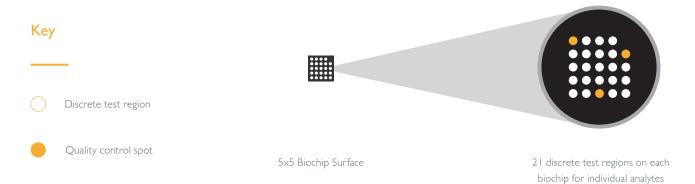

Higher Throughput

The Biochip can assess up to 45 samples in under three hours using the semi-automated Evidence Investigator.

Multiplex Explained

Randox's patented Biochip Array Technology (BAT) is based upon a competitive immunoassay format but provides multiple results from a single sample. BAT utilises a nano-spotting technique to create a versatile array which can accommodate 21 discrete test regions (DTRs).

Each DTR is coated with a single high quality, engineered antibody which is used to detect the presence of multiple compounds. Multiplex screening increases the throughput of testing, greatly reduces labour requirements and provides unrivalled test consolidation.

Evidence Investigator

The Evidence Investigator is a compact, semi-automated benchtop analyser. Utilising the revolutionary Biochip Array Technology (BAT), the Evidence Investigator is a multi-analyte, semi-quantitative analyser. Using BAT, the Evidence Investigator ensures that screening feed and food for toxins and drug residues is accurate and efficient, offering laboratories comparable results to that of LC-MS/MS and other confirmatory methods.

Analyser Process

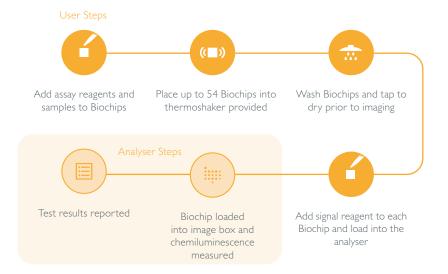

Image Processing

The analyser uses unique image processing software to translate the Relative Light Units (RLU) generated from the chemiluminescent reactions into a qualitative or semi-quantitative result.

On Board Data Analysis

No manipulation of results is required, reducing scope for operator error. The Evidence Investigator provides excellent sensitivity with either a semiquantitative or qualitative result for each analyte.

Multiplex Technology

Using multiplex technology, the Evidence Investigator can provide simultaneous detection for a wide range of analytes from a single sample.

True Cost Reduction

Multiplex testing reduces the amount of time and labour spent on individual tests as well as associated laboratory costs.

Technical Snapshot

Analyser Description Semi-automated Biochip Array analyser

Dimensions 750 (h) \times 480 (d) \times 420 (w) mm

Weight 24kg / 52.9lbs

Biochip Format I × Biochip carrier (Holds 9 individual Biochips)

Maximum Throughput 45 samples in 2 hours 30 minutes*

Accreditation Internally accredited to full CE & UL certification

Measurement Principal Competitive techniques with chemiluminescent

reaction

^{*}can be increased with multiple thermoshakers (Cat No. EV700-997)

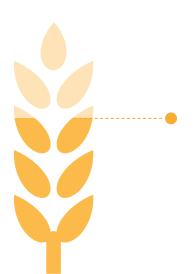

Mycotoxin Analysis

Mycotoxins are a group of naturally occurring toxins produced as secondary metabolites by certain moulds. They can occur in a variety of different crops and are estimated to be responsible for losses of 5-10% of crop production globally. Moreover, mycotoxin occurrence patterns are constantly changing around the world, due to climate change causing extreme weather conditions.

Consumption of mycotoxins can result in significant adverse health effects in humans and animals and as a result, international food standards recommend that food producers conduct regular routine screening for mycotoxins.

Why Test for Multiple Mycotoxins?

Recent, reliable studies have been published showing that, when 21,709 samples of various crops were tested, the majority of samples contained multiple mycotoxins. The combination of multiple mycotoxins has detrimental effects on human health, these mycotoxins can also affect various animal species causing lowered production rates and significant economic losses.

67% of 21,709 samples showed a presence of more than one mycotoxin.

Biomin 2020, Published in 2021.

Mycotoxin Biochip Arrays

Randox Food Diagnostics have developed a range of screening arrays to allow multiple detection of groups of mycotoxins from a single sample. All Randox Food's mycotoxin tests are simple to use and require a single step liquid to liquid extraction method, removing the need for multiple extraction procedures.

Validated Matrices

We provide mycotoxin testing for the following matrices within our Biochip product range.

Cereal based animal Feed (complete)	Rapeseed
Sugar Beet	Rye
Corn / Maize	Soya
Barley	Wheat
Cotton Seed	Oat
Sunflower Seed	-

Validated in accordance with Commission Decision 2002/657/EC and Commission Regulation (EU) No 519/2014. Further evaluated matrices available on request.

Advantages of Multiplex Testing

- Detection of multiple mycotoxins from a single sample, using a single step liquid to liquid extraction method
- Increased detection capacity
- Reduced number of samples for confirmatory analysis
- Reduced cost analysis
- Reduced labour load, laboratory consumables and storage requirements

Randox Food Diagnostics is a regular participant in the FAPAS proficiency testing scheme for mycotoxins. FAPAS is the largest and most comprehensive analytical chemistry proficiency testing scheme in the food sector. The scheme has more than 2000 participants in over 100 countries.

Proficiency testing is an independent, confidential check of a laboratory's performance and usually involves participating laboratories running one 'blind' sample that is provided by the proficiency testing company.

Each laboratory is given a number as their reference.

The aim is to get as close a score to the assigned value as possible. This is presented on a Z-Score scale, where the value is a perfect 0.

Case Study

Test material from the scheme was assessed with Randox Food Diagnostics' mycotoxin Biochip Array for ochratoxin A (OTA).

An assigned value was determined for the analyte and, in conjunction with the standard deviation for proficiency, was used to calculate a z-score for a result.

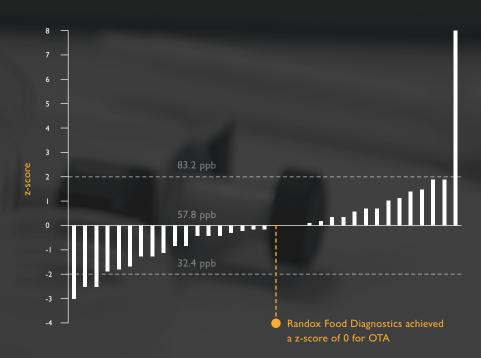

With 35 laboratories participating in this study, Randox Food Diagnostics achieved a perfect score of 0, scoring higher than the majority of participants including multiple confirmatory systems.

Results

Analyte	Z-Score	Assigned Value (ppb)	Result (ppb)	LOD (ppb)
OTA*		57.8	57.2	0.4

*FAPAS sample number 17146

Z-Scores for OTA

Randox Food Diagnostics regularly take part in various proficiency tests for multiple analytes on our mycotoxin arrays, these are available upon request.

Drug Residue for Feed & Ce

Coccidiostats

Coccidiosis is a parasitic disease of animal intestinal tracts caused by coccidian protozoa. Symptoms usually include bloody droppings, weight loss and mortality in young chickens. To prevent infection, farmers may administer prophylactic antiprotozoal coccidiostats in feed, which increases the chance that coccidiostat residues are retained in both poultry, meat and eggs.

Randox Food Diagnostics now offers one of the most comprehensive tests on the market for the detection of coccidiostat residues. The coccidiostats array for Biochip provides screening and semi-quantitative detection of 10 different coccidiostats from a single sample of premixed and medicated final feed including the detection of 15 anticoccidials across 10 assays.

Testing reals

Growth Promoters

Growth promoters have been used by the livestock industry for over 30 years to improve an animal's ability to more efficiently utilize nutrients and produce leaner meat. Anabolic steroids along with ractopamine and other growth promoting steroids must also be monitored very carefully in meat and animal feed. Insufficient withdrawal periods, once an animal has been fed with feeds containing these drugs, can lead to contaminated meat entering the food chain.

As a result, the use of growth-promoting hormones in livestock production is either prohibited (European Union) or strongly regulated (e.g. USA, Canada and Australia). Compliance with these regulations is monitored by national monitoring programmes.

Antimicrobials

Antimicrobial compounds have been used in food production to treat and prevent infections and to function as growth promoters. However, serious health concerns exist about the presence of antimicrobial compounds in food and the development of antibiotic resistant strains of micro-organisms due to inappropriate use. As a result of these concerns, many countries have banned or limited the use of antimicrobials in food producing animals and have set maximum residue limits (MRLs).

Randox Food Diagnostics offer both Biochip Array Technology and ELISA test kits for the detection of antimicrobials in feed.
